B9. Επεξεργασία φυσικής γλώσσας με Transformers και μεγάλα γλωσσικά μοντέλα

(2023-24)

Ίων Ανδρουτσόπουλος http://www.aueb.gr/users/ion/

Contents

- Transformer encoders and decoders.
- Pre-trained Transformers and Large Language Models (LLMs), BERT, GPT-3, Chat-GPT, fine-tuning them, prompting them.
- Retrieval augmented generation (RAG), LLMs with tools.

Reminder: stacked CNNs for classification/regression												
$h^{max} = \left\langle \max\left(h_{*,1}^{(4)}\right), \max\left(h_{*,2}^{(4)}\right), \dots, \max\left(h_{*,m}^{(4)}\right) \right\rangle^{T} \in \mathbb{R}^{1 \times m}$												
global max pooling									Feature vector sent to a document classifier or regressor (e.g., MLP).			
pad	$h_{1}^{(4)}$	$h_{2}^{(4)}$	$h_{3}^{(4)}$	$h_{4}^{(4)}$	$h_{5}^{(4)}$	•••	$h_{n-1}^{(4)}$	$h_n^{(4)}$	pad	4^{th} convolution layer (<i>m</i> filters)		
pad	$h_{1}^{(3)}$	$h_{2}^{(3)}$	$h_{3}^{(3)}$	$h_{4}^{(3)}$	$h_{5}^{(3)}$	•••	$h_{n-1}^{(3)}$	$h_n^{(4)}$	pad	3^{rd} convolution layer (<i>m</i> filters)

pad	$h_1^{(1)}$	$h_{2}^{(1)}$	$h_{3}^{(1)}$	$h_{4}^{(1)}$	$h_{5}^{(1)}$	•••	$h_{n-1}^{(1)}$	$h_n^{(1)}$	pad	1^{st} convolution layer (<i>m</i> filters)		
pad	<i>x</i> ₁	<i>x</i> ₂	<i>x</i> ₃	<i>x</i> ₄	$\frac{1}{x_5}$	••••	x_{n-1}	x_n	pad	<i>m</i> -dimensional word embeddings		

$$h_{i}^{(1)} = \operatorname{ReLU}\left(W^{(1)}[x_{i-1}; x_{i}; x_{i+1}] + b^{(1)}\right) + x_{i} \in \mathbb{R}^{m \times 1}$$
$$h_{i}^{(j)} = \operatorname{ReLU}\left(W^{(j)}\left[h_{i-1}^{(j-1)}; h_{i}^{(j-1)}; h_{i+1}^{(j-1)}\right] + b^{(j)}\right) + h_{i}^{(j-1)} \in \mathbb{R}^{m \times 1}$$

Residual (shortcut) connection, needed when stacking many CNNs (or RNNs).

Reminder: stacked CNNs for token classification

$$h_i^{(1)} = \operatorname{ReLU}\left(W^{(1)}[x_{i-1}; x_i; x_{i+1}] + b^{(1)}\right) + x_i \in \mathbb{R}^{m \times 1}$$
$$h_i^{(j)} = \operatorname{ReLU}\left(W^{(j)}\left[h_{i-1}^{(j-1)}; h_i^{(j-1)}; h_{i+1}^{(j-1)}\right] + b^{(j)}\right) + h_i^{(j-1)} \in \mathbb{R}^{m \times 1}$$

Transformers for token classification

$$h_{1}^{(4)} h_{2}^{(4)} h_{3}^{(4)} h_{4}^{(4)} h_{5}^{(4)} \cdots h_{n-1}^{(4)} h_{n}^{(4)} h_{1}^{(3)} h_{2}^{(3)} h_{3}^{(3)} h_{4}^{(3)} h_{5}^{(3)} \cdots h_{n-1}^{(3)} h_{n}^{(4)} h_{1}^{(2)} h_{2}^{(2)} h_{3}^{(2)} h_{4}^{(2)} h_{5}^{(2)} \cdots h_{n-1}^{(2)} h_{n}^{(2)} h_{1}^{(1)} h_{2}^{(1)} h_{3}^{(1)} h_{4}^{(1)} h_{5}^{(1)} \dots h_{n-1}^{(1)} h_{n}^{(1)} h_{1}^{(1)} \frac{a_{2,2}}{x_{1} x_{2} x_{3} x_{4} x_{5} \cdots x_{n-1} x_{n}}$$
 Initial *m*-dimensional word embeddings

$$h_{i}^{(1)} = MLP^{(1)} \left(\sum_{r=1}^{n} a_{i,r}^{(1)} x_{r} \right) \in \mathbb{R}^{m}$$
 To produce the **revised embedding for the** *i*-th word of a text, we sum all the original embeddings of the words of the.

text, but weighted by attention scores.

Transformers for token classification

Compare to the correct predictions and **adjust the weights** of the **entire neural net**, including the bottom word (token) embeddings, which are randomly initialized.

Predicted labels of words

Initial *m*-dimensional word embeddings

To produce the **revised embedding for the** *i*-th word of a text, we sum all the original embeddings of the words of the text, but weighted by attention scores.

Transformers for text classification

$$h^{max} = \left(\max \left(h_{*,1}^{(4)} \right), \max \left(h_{*,2}^{(4)} \right), \dots, \max \left(h_{*,m}^{(4)} \right) \right)^{T} \in \mathbb{R}^{m}$$

$$for each dimension = \left(\max of each dimension \right)^{T} \in \mathbb{R}^{m}$$

$$h_{1}^{(4)} \quad h_{2}^{(4)} \quad h_{3}^{(4)} \quad h_{4}^{(4)} \quad h_{5}^{(4)} \quad \dots \quad h_{n-1}^{(4)} \quad h_{n}^{(4)}$$

$$h_{1}^{(3)} \quad h_{2}^{(3)} \quad h_{3}^{(3)} \quad h_{4}^{(3)} \quad h_{5}^{(3)} \quad \dots \quad h_{n-1}^{(3)} \quad h_{n}^{(4)}$$

$$h_{1}^{(2)} \quad h_{2}^{(2)} \quad h_{3}^{(2)} \quad h_{4}^{(2)} \quad h_{5}^{(2)} \quad \dots \quad h_{n-1}^{(2)} \quad h_{n}^{(2)}$$

$$h_{1}^{(1)} \quad h_{2}^{(1)} \quad h_{3}^{(1)} \quad h_{4}^{(1)} \quad h_{5}^{(1)} \quad \dots \quad h_{n-1}^{(1)} \quad h_{n}^{(1)}$$

$$h_{1}^{(1)} \quad h_{2}^{(1)} \quad h_{3}^{(1)} \quad h_{4}^{(1)} \quad h_{5}^{(1)} \quad \dots \quad h_{n-1}^{(1)} \quad h_{n}^{(1)}$$

$$h_{1}^{(1)} \quad HLP^{(1)} \left(\sum_{r=1}^{n} a_{i,r}^{(1)} x_{r} \right) \in \mathbb{R}^{m}$$

$$h_{i}^{(j)} = \operatorname{MLP}^{(j)} \left(\sum_{r=1}^{n} a_{i,r}^{(j)} h_{r}^{(j-1)} \right) \in \mathbb{R}^{m}$$
Without the MLP (or at least a dense layer), each dimension of $h_{i}^{(j)}$ would only depend on the corresponding dimensions of the $h_{r}^{(-1)}$ vectors.

Query-Key-Value self-attention

pad	$h_{1}^{(4)}$	$h_{2}^{(4)}$	$h_{3}^{(4)}$	$h_{4}^{(4)}$	$h_{5}^{(4)}$	•••	$h_{n-1}^{(4)}$	$h_n^{(4)}$	pad	4 th attention layer

Stacking Transformer Encoders

(<u>https://jalammar.github.io/illustrated-transformer/</u>). Transformers paper: Vaswani et al., "Attention is All You Need", 2017 (<u>https://arxiv.org/abs/1706.03762</u>).

Query-Key-Value attention via matrices

(https://jalammar.github.io/illustrated-transformer/). Transformers paper: Vaswani et al., "Attention is All You Need", 2017 (https://arxiv.org/abs/1706.03762).

Multiple attention heads Optional material

Figures from J. Alammar's "The Illustrated Transformer" (<u>https://jalammar.github.io/illustrated-transformer/</u>). Transformers paper: Vaswani et al., "Attention is All You Need", 2017 (<u>https://arxiv.org/abs/1706.03762</u>).

Positional encodings

Positional encodings needed to capture the **word order/positions**:

- Without them, Transformers are unaware of word order.
- Sinusoid functions used to produce them in the original paper.
- But can also be **position embeddings** learned during training.
 - Embedding of **position 1**, embedding of **position 2** etc.

Figures from J. Alammar's "The Illustrated Transformer" (<u>https://jalammar.github.io/illustrated-transformer/</u>). Transformers paper: Vaswani et al., "Attention is All You Need", 2017 (<u>https://arxiv.org/abs/1706.03762</u>).

Complete Transformer encoder block

BERT – Pretraining to predict masked words

BERT's clever language modeling task masks 15% of words in the input and asks the model to predict the missing word.

Figures from J. Alammar's "The Illustrated BERT, ELMo, and co." (<u>http://jalammar.github.io/illustrated-bert/</u>). BERT paper: Devlin et al., "BERT: Pre-training of Deep Bidirectional Transformers for Language Understanding", 2018 (<u>https://arxiv.org/abs/1810.04805</u>).

BERT – Pretraining to predict the next sentence

The second task BERT is pre-trained on is a two-sentence classification task. The tokenization is oversimplified in this graphic as BERT actually uses WordPieces as tokens rather than words --- so some words are broken down into smaller chunks.

15

Figures from J. Alammar's "The Illustrated BERT, ELMo, and co." (<u>http://jalammar.github.io/illustrated-bert/</u>). BERT paper: Devlin et al., "BERT: Pre-training of Deep Bidirectional Transformers for Language Understanding", 2018 (<u>https://arxiv.org/abs/1810.04805</u>).

BERT – Fine-tuning for sentence classification

We feed the context-aware embedding of the [CLS] token of each sentence to a taskspecific classifier (e.g., MLP) that classifies the sentence (e.g., Positive, Neutral, Negative etc.)

Starting from the **pre-trained BERT**, we **jointly train BERT** (further) and the task-specific classifier on (possibly few) taskspecific training examples (e.g., tweets + opinion labels).

BERT – Fine-tuning for token classification

BERT – Fine-tuning for textual entailment

Machine Reading Comprehension (MRC)

Question

Paragraph

In meteorology, precipitation is any product of the condensation of atmospheric water vapor that falls under **gravity**. The main forms of precipitation include drizzle, rain, sleet, snow, **graupel** and hail... Precipitation forms as smaller droplets coalesce via collision with other rain drops or ice crystals within a cloud. Short, intense periods of rain in scattered locations are called "showers".

What causes precipitation to fall? gravity

What is another main form of precipitation besides drizzle, rain, snow, sleet and hail? graupel

Where do water droplets collide with ice crystals to form precipitation? within a cloud

Figure from P. Rajpurkar et al., "SQuAD: 100,000+ Questions for Machine Comprehension of Text.", EMNLP 2016 (<u>https://aclweb.org/anthology/D16-1264</u>).

BERT – Fine-tuning for MRC

Hugging Face Transformers

https://huggingface.co/models

Reminder: RNN-based MT system

Stacked Transformer encoders-decoders

Figure from J. Alammar's "The Illustrated Transformer" (<u>https://jalammar.github.io/illustrated-transformer/</u>). Transformers paper: Vaswani et al., "Attention is All You Need", 2017 (<u>https://arxiv.org/abs/1706.03762</u>).

Decoder only Transformers

- The encoder and the cross-attention part of the decoder are removed.
- The decoder is given the previous (sub-)words, predicts the next one.
 - Similarly to how BERT predicts masked tokens, but we always predict the next token, looking at (attending) previous tokens only.
 - It is trained on huge plain-text collections from the Web as a language model.
- This is how, e.g., **GPT-2** and **GPT-3** were trained.

Figure from Vaswani et al., "Attention is All You Need", 2017 (<u>https://arxiv.org/abs/1706.03762</u>), modified by C.R. Wolfe (<u>https://twitter.com/cwolferesearch/status/1640446111348555776</u>).

Prompt engineering in GPT-3

Prompt

I am a highly intelligent question answering bot. If you ask me a question that is rooted in truth, I will give you the answer. If you ask me a question that is nonsense, trickery, or has no clear answer, I will respond with "Unknown".

Q: What is human life expectancy in the United States? A: Human life expectancy in the United States is 78 years.

Q: Who was president of the United States in 1955?A: Dwight D. Eisenhower was president of the United States in 1955.

Q: Which party did he belong to? A: He belonged to the Republican Party.

Q: What is the square root of banana? A: Unknown

Q: How does a telescope work? A: Telescopes use lenses or mirrors to focus light and make objects appear closer.

Q: Where were the 1992 Olympics held? A: The 1992 Olympics were held in Barcelona, Spain.

Q: How many squigs are in a bonk? A: Unknown

Q: Where is the Valley of Kings? A:

Sample response

The Valley of Kings is located in Luxor, Egypt.

- We give to a large pre-trained LM a few examples ("demonstrations") of the desired behavior as (concatenated) input, then (also concatenated in the input) a similar instance to be completed.
 - We can also include a preamble saying what kind of agent (e.g., intelligent, polite) the system is supposed to be.

• No fine-tuning involved!

• A **single frozen pre-trained model** can serve multiple tasks, with few examples.

GPT-3 paper:

https://papers.nips.cc/paper/2020/file/1457c0d6bf cb4967418bfb8ac142f64a-Paper.pdf GPT-3 examples from: https://beta.openai.com/examples/default-qa

See also: https://gaotianyu.xyz/prompting/

Supervised fine-tuning on human responses

• Just with prompting, without any fine-tuning, large LMs (LLMs, e.g., GPT-3) often fail to provide useful responses, fail to follow instructions, may generate toxic responses...

• Q: What is the capital of Greece? A: Why the %%\$\$ do you care?

- More recent LLMs, like **Instruct-GPT**, **ChatGPT**, use additional (after pre-training) **supervised fine-tuning (SFT)** on **human authored responses** to **learn to reply appropriately**.
 - Having **pre-trained the model to predict the next words** (autocomplete), now **further train it to respond to requests as humans** did.
 - Back to pre-train then fine-tune, but without task-specific fine-tuning...

Prompt:

Serendipity means the occurrence and development of events by chance in a happy or beneficial way. Use the word in a sentence.

Labeler demonstration

Running into Margaret and being introduced to Tom was a fortunate stroke of serendipity.

Figure from Ouyang et al. (2022), "Training language models to follow instructions with human feedback" (https://arxiv.org/abs/2203.02155). 26

Supervised fine-tuning on human responses

Prompt:

Serendipity means the occurrence and development of events by chance in a happy or beneficial way. Use the word in a sentence.

Labeler demonstration

Running into Margaret and being introduced to Tom was a fortunate stroke of serendipity.

GPT-3 175B completion:

Serendipity is the ability to see something good in something bad. Use the word in a sentence.

Serendipity means to be happy with what you have. Use the word in a sentence.

Serendipity means finding something good in something that is bad. Use the word in a sentence.

InstructGPT 175B completion:

Serendipity can be defined as the happy chance occurrence of events leading to a beneficial outcome. For example, when Lori first moved to the city and started her job search, it was serendipity that she stumbled upon the perfect opportunity and was able to start her career in marketing with a company she truly loves.

Figure from Ouyang et al. (2022), "Training language models to follow instructions with human feedback" (<u>https://arxiv.org/abs/2203.02155</u>). 27

Supervised fine-tuning on human responses

Prompt:

Based on the following passage, provide one bullet point of evidence of a positive trend in the employment market, and one bullet point of a negative trend in the employment market, (use a "-" as a bullet point, Capitalize the first letter of the first word for each bullet point, and include a period at the end of each bullet point).

The number of applications for unemployment benefits has held steady in September at just under 900,000 a week, as employer uncertainty about the economic recovery six months into the coronavirus pandemic continued to restrain hiring gains.

Jobless claims increased slightly to 870,000 last week from 866,000 a week earlier, according to Thursday's Labor Department report. The totals remain well above pre-pandemic peaks but are down significantly from nearly seven million in March.

The labor market has added jobs in the prior four months after steep declines in employment at the beginning of the pandemic, helping bring down the jobless rate to 8.4% in August from near 15% in April. But the pace of gains has slowed recently, and persistently elevated jobless claims in September point to continued cooling in the jobs market.

Labeler demonstration

-The jobless rate went from 15% in April to 8.4% in August. -Jobless claims have increased from 860,000 to 870,000.

GPT-3 175B completion:

Correspondingly, the number of people actively looking for work has been more than 1 million higher on a seasonally adjusted basis every week since mid-May than it was at the beginning of the pandemic. More than 8 million people have been out of work for at least 27 weeks, the most since data collection began in 1948.

The number of people who have been out of work for six months or more has remained at more than 2 million for the past four months, up from 1.5 million a year ago. The number of people out of work for more than 26 weeks has increased for the past five months to more than 2.5 million. That's the highest since 1996, when the government began tracking the data.

"We're seeing unemployment rates going down, but we're not seeing people getting jobs," said James Glassman, a former Federal Reserve economist who is president of the Washington-based Center for Strategic and International Studies.

InstructGPT 175B completion:

- One bullet point of evidence of a positive trend in the employment market could be that recent job gains have been greater than in prior months, signaling a possible overall improvement in the labor market.

- One bullet point of evidence of a negative trend in the employment market could be that the labor market continues to experience high levels of uncertainty and slower growth, which may inhibit employers from hiring or retaining staff.

Figure from Ouyang et al. (2022), "Training language models to follow instructions with human feedback" (https://arxiv.org/abs/2203.02155).

Reinforcement learning from human feedback

- Humans also provide meta-data showing if any of the model's responses are toxic, fail to follow the instructions etc.
- **Humans** are also asked to **rank** multiple responses generated by the system (possibly also by humans).
- This human feedback (meta-data and rankings) is used to further finetune the model with reinforcement learning (RLHF).
- SFT and RLHF (PPO) both help • generate more useful responses.

Output A										
summaryl										
Rating (1 = worst, 7 = best)										
1	2	3	4	5	6	7				

Fails to follow the correct instruction / task ?	OYes	No
Inappropriate for customer assistant ?	OYes	No
Contains sexual content	OYes	No
Contains violent content	OYes	No
Encourages or fails to discourage violence/abuse/terrorism/self-harm	OYes	No
Denigrates a protected class	OYes	No
Gives harmful advice ?	OYes	No
Expresses moral judgment	OYes	No

Figures from Ouyang et al. (2022), "Training language models to follow instructions with human feedback" (https://arxiv.org/abs/2203.02155). 29

Chain-of-thought prompting

Standard Prompting

Model Input

A: The answer is 11.

Model Output

A: The answer is 27.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Chain-of-Thought Prompting

Model Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: Roger started with 5 balls. 2 cans of 3 tennis balls each is 6 tennis balls. 5 + 6 = 11. The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Model Output

A: The cafeteria had 23 apples originally. They used 20 to make lunch. So they had 23 - 20 = 3. They bought 6 more apples, so they have 3 + 6 = 9. The answer is 9.

- The **demonstrators** (few-shot examples in the prompt) now also **include** text explaining the **reasoning that led to each answer**.
 - We prompt the model to generate both the answer and its reasoning.
 - **Performance** often **improved** and **we also get some explanation** (?).

Figure from Wei et al. (2022), "Chain-of-thought prompting elicits reasoning in large language models", NeurIPS 2022 (<u>https://arxiv.org/abs/2201.11903</u>).

- Given a **question** we first **retrieve relevant documents** (or snippets) and **add** them to the **input of the LLM**.
 - We can use **conventional IR** (e.g., TF-IDF, BM25) or **dense retrieval** (documents and questions encoded, compared via a similarity function).
 - Input (prompt) to the LLM: question, retrieved documents (or snippets), instructions telling the LLM to base its answer on the retrieved documents, possibly few-shot examples (demonstrators).

Figure from G. Right's blog post, "What is Retrieval Augmented Generation?", September 2023 (<u>https://www.linkedin.com/pulse/what-retrieval-augmented-generation-grow-right/</u>).

RAG – continued

- Knowledge in the parameters of the model:
 - May include **common sense**, **encyclopedic**, **language knowledge/skills**, which may be **difficult to obtain from retrieved documents**.
 - **Difficult to update** (requires retraining), **not reliable** (e.g., hallucinations), **no sources** (e.g., references)
- Knowledge in retrieved documents:
 - Easily updated (e.g., new news articles), can be restricted to trusted sources (e.g., scientific articles from respected journals).
 - But **needs to be understood, filtered (**e.g., keep only parts relevant to the question), **combined** (e.g., information from multiple snippets), turned into an **answer**, hopefully by the LLM.

Figure from G. Right's blog post, "What is Retrieval Augmented Generation?", September 2023 (<u>https://www.linkedin.com/pulse/what-retrieval-augmented-generation-grow-right/</u>).

Figure from https://github.com/features/copilot.

LLMs with tools

The prompt now includes descriptions of the available tools and examples of requests, correct chains-of-thought (CoT), correct code. The model responds similarly.

Figure from https://huggingface.co/docs/transformers/transformers agents.

LLMs with tools

audio = agent.run("Read out loud the summary of http://hf.co")
play_audio(audio)

==Explanation from the agent==
I will use the following tools: `text_downloader` to
download the text from the website, `summarizer` to create a
summary of the text, and `text_reader` to read it out loud.

==Code generated by the agent==
text = text_downloader("https://hf.co")
summarized_text = summarizer(text)
print(f"Summary: {summarized_text}")
audio_summary = text_reader(summarized_text)

==Result== Summary: Hugging Face is an AI community building the future. More than 5,000 organizations are using Hugging Face's AI chat models. The hub is open to all ML models and has support from libraries like Flair, Asteroid, ETSPnet and Pyannote.
