Ευφυή Κινητά Δίκτυα: Σύστημα Κινητής Τηλεφωνίας 2ης γενεάς (2G): GSM και GPRS

Εαρινό Εξάμηνο 2022-23

Βασίλειος Σύρης

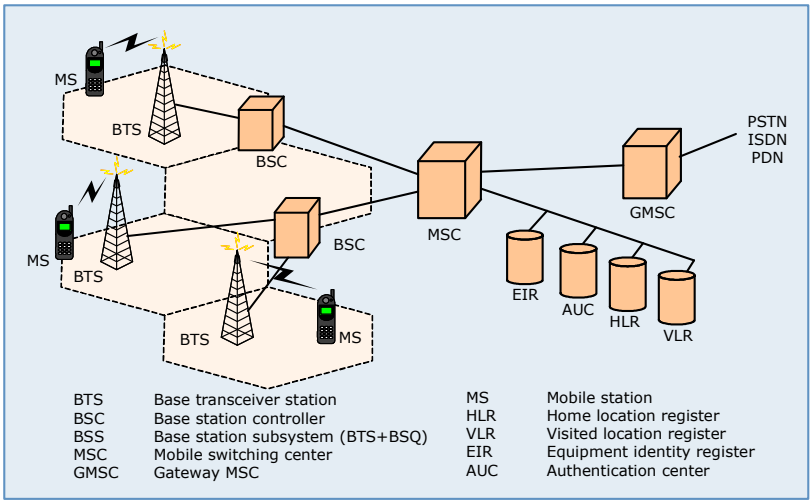
1

GSM frequency bands (common)

- GSM-900 and GSM-1800
  - Europe, Middle East, Africa, most of Asia
- GSM-850 and GSM-1900
  - USA, Canada, other countries in America
- GSM-400 and GSM-450 rarer

2

Network architecture



3

Network elements

- Mobile Station
  - Mobile Equipment
    - Identified by the International Mobile Equipment Identity (IMEI)
  - Subscriber Identity Module (SIM)
    - Contains a unique identification number called IMSI
    - It is removable, thus irrespective of a specific terminal

4

- Base Station Subsystem (BSS)
  - Base Transceiver Station (BTS)
    - A BTS is comprised of radio transceivers, antennas, the interface to the PCM facility
    - BTS is the entity that connects the mobiles to a cellular network
  - Base Station Controller (BSC)
    - Its primary function is call maintenance, by deciding when to initiate a handover, changing the BTS transmitter power, etc.
    - A BSC is connected to a group of BTSs and manages the radio resources for them

5

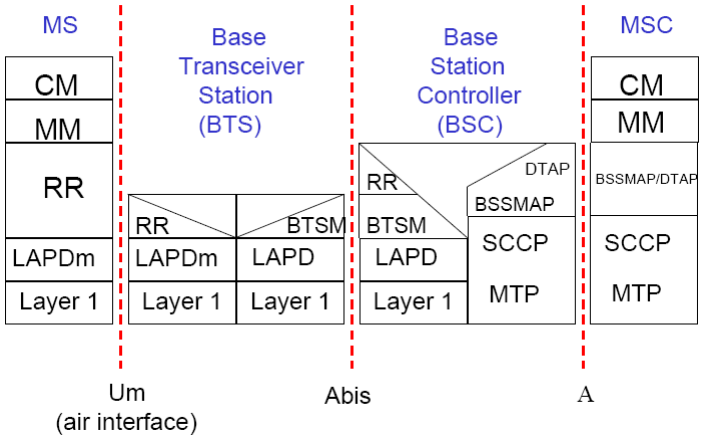
- Network Subsystem
  - Mobile Switching Center (MSC)
    - MSC provides functions such as registration, authentication, location updating, handovers and call routing to a roaming subscriber
  - Home Location Register (HLR)
    - The HLR contains all the administrative information and current location of each subscriber registered in the corresponding GSM network
  - Visitor Location Register (VLR)
    - Contains subscription information needed for call control, for all mobiles in the area of the associated MSC
  - Equipment Identity Register (EIR)
    - EIR is a database that contains a list of all valid mobile equipment on the network
  - Authentication Center (AUC)
    - Stores the secret key held in each user's SIM card

6

- Application Service Centers are responsible for GSM network add-on services
  - Operation and Maintenance Center (OMC)
    - Monitoring and control the network
    - Usually connect with MSC, BSC, HLR, and other service centers
  - Short Message Service Center (SMSC)
    - provide short message services
    - usually connect to MSC
  - Unstructured Supplementary Service Data Center (USSDC)
    - provide USSD service in the form of *ID*ID*info#
    - usually connect to HLR

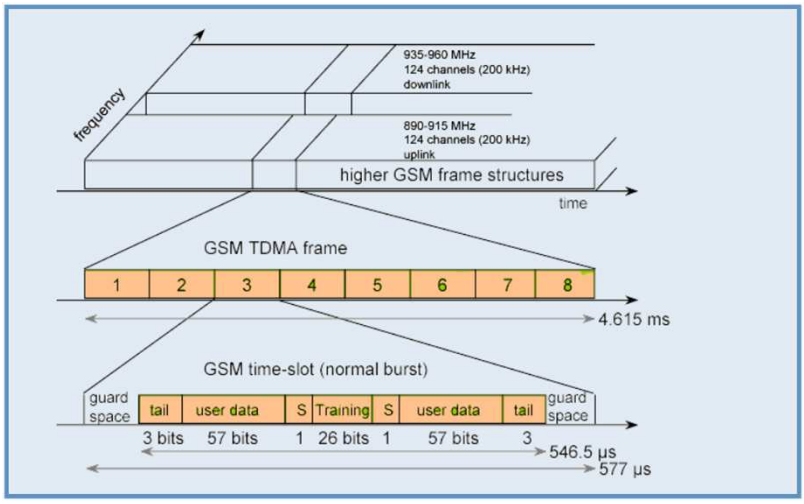
7

Protocol stack



8

GSM FDMA/TDMA



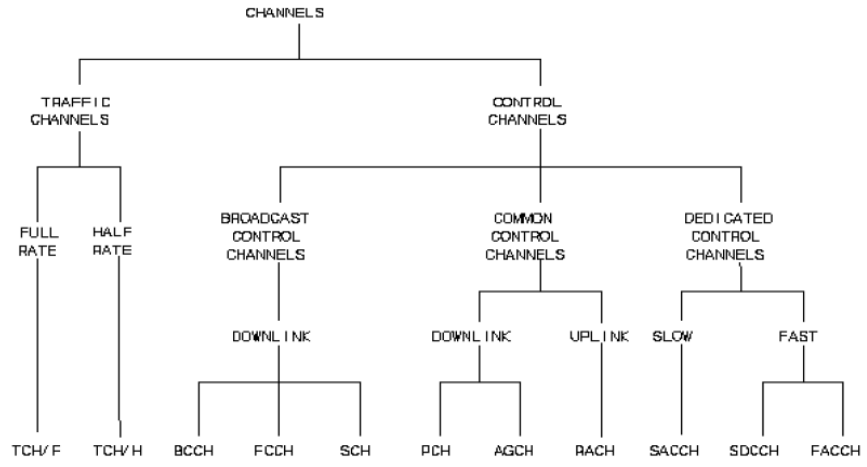
9

GSM channels

- Physical channel: specific time slot and channel/carrier frequency
- Logical channels
  - run over physical channels (not necessarily in all time slots)
  - two types: traffic and control
  - managed: setup, maintenance, tear-down
- Control channels interspersed with traffic channels in well-defined ways

10

GSM logical channels



11

Traffic channels

- Full rate: 22.8 kbps
  - speech data: 13 kbps voice data + FEC
  - packet data: 12,6,3.6 kbps + FEC
- Half rate: 11.4 kbps
- To achieve higher rates multiple logical channels have to be allocated (GPRS does this)

12

Control channels

- Help MS locate control channels
- Provide information about
  - voice and control channel repetition cycle.
  - parameters in the cell
  - surrounding cells
  - paging
- Allow random access attempts by the MS

13

Broadcast Control Channels

- FCCH (Frequency Correction Channel)
  - carrier synchronization
  - base station “beacon” signal
- SCH (Synchronization Channel)
  - frame synchronization
- BCCH (Broadcast Control Channel)
  - cell ID, available services, etc

14

Common Control Channels

- PCH (Paging Channel) - downlink
  - page a mobile
- AGCH (Access Grant Channel) - downlink
  - reply to a random access request, assign dedicated control channel
- RACH (Random Access Channel) – uplink
  - used by mobile to request dedicated control channel
  - messages from several mobiles can collide
  - Slotted Aloha used for contention resolution

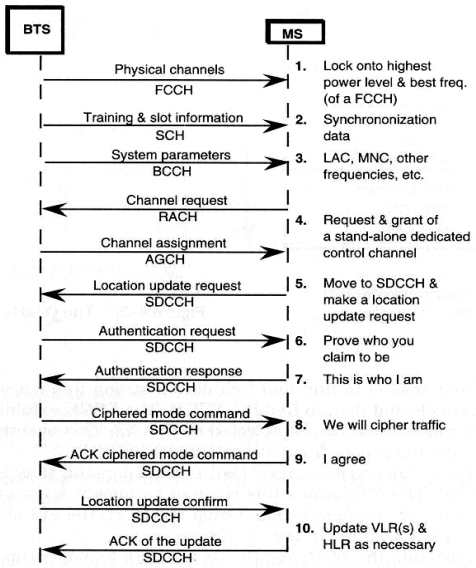
15

Dedicated and Control Channels

- SACCH (Slow Associated Control Channel)
  - in-band signaling
  - downlink: system info, power control
  - uplink: measurements
- FACCH (Fast Associated Control Channel)
  - in-band time-critical signaling
  - call establishment progress, authentication, handover signaling
- SDCCH (Stand-alone Dedicated Control Channel)
  - out-of-band signaling
  - call setup signaling, SMS, location update

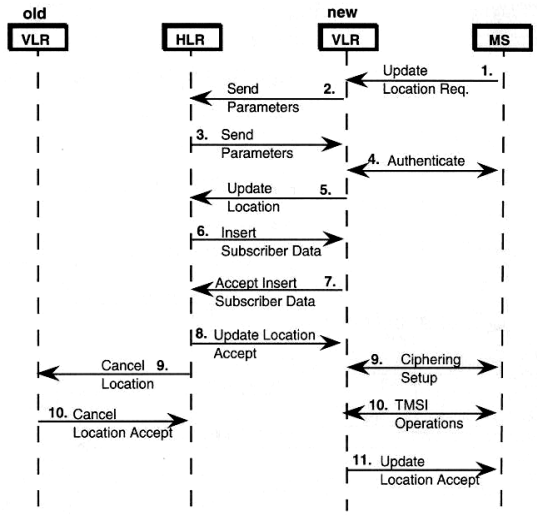
16

Mobile initialization



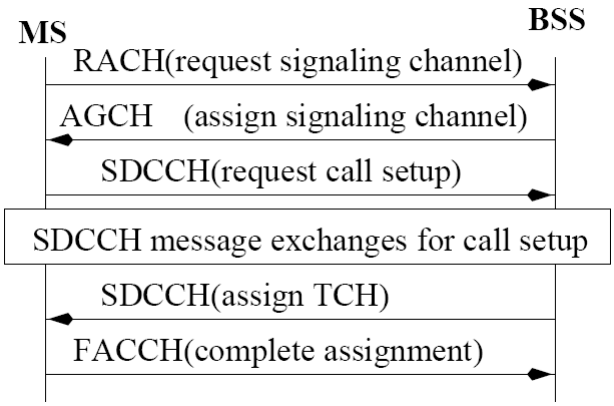
17

Location update



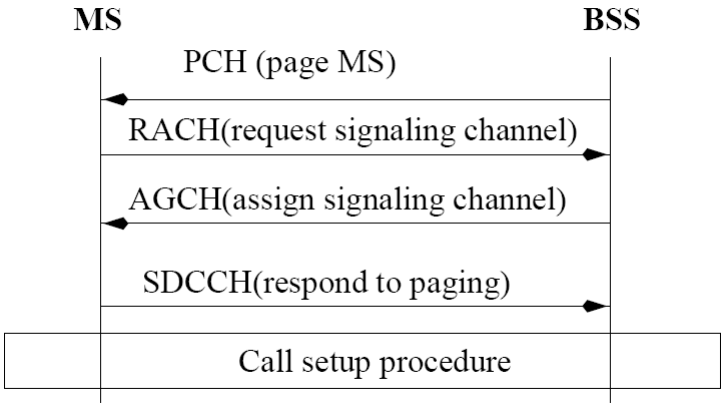
18

Call origination (MS->BSS)



19

Call termination (BSS->MS)



20

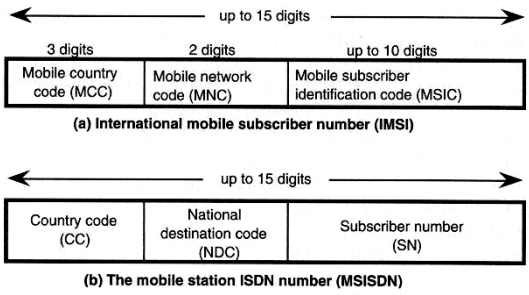
Network elements

- Mobile Station
  - Mobile Equipment
    - Identified by the International Mobile Equipment Identity (IMEI)
  - Subscriber Identity Module (SIM)
    - Contains a unique identification number called IMSI
    - It is removable, thus irrespective of a specific terminal

21

GSM identifiers

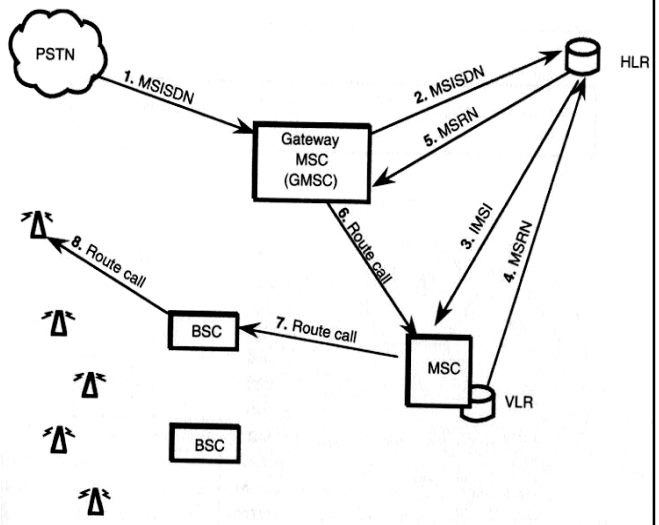
- IMSI: non-dialable number
  - MCC Greece: 202
  - Bound to SIM
- TMSI: Temporary MSI (confidentiality)
- MS ISDN number (dialable)
  - Different MS ISDN associated to same SIM



22

Call routing

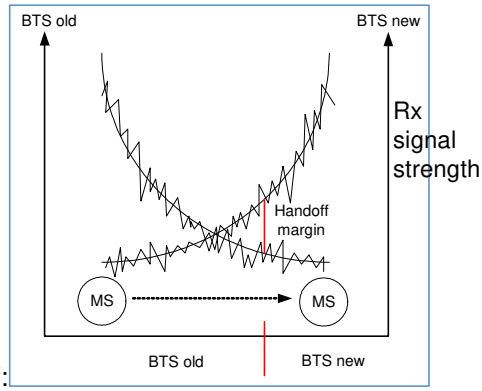
- IMSI: International Mobile Subscriber Identifier
- MSISDN: MS ISDN (called number)
- MSRN: Mobile Station Routing Number



23

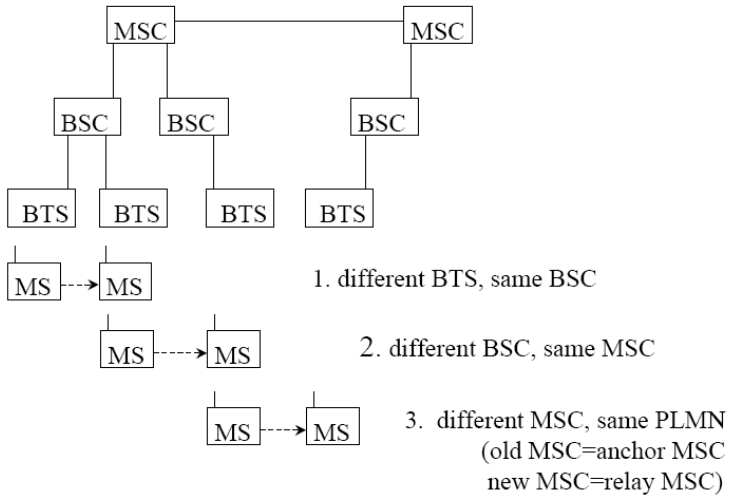
Mobility management

- Location Registration
- Call delivery
- Handoff Management
  - Handoff is caused by:
    - signal strength deterioration
    - user mobility
  - There are two kinds of handoff:
    - soft handoff
    - hard handoff
  - There are three ways to handoff:
    - network-controlled handoff
    - mobile-assisted handoff
    - mobile-controlled handoff



24

Three cases of handovers



25

Power control

- Operator-dependant
- Mobile:
  - Peak Tx power classes: GSM-900: 8,5,2,0.8 Watt (39,37,33,29 dBm), GSM-1800: 1,0.25,4 Watt (30,24,36 dBm)
  - minimum Tx power: GSM-900: 19mW, GSM-1800: 15mW
  - step: 2dBm
- Base station:
  - 8 classes: 320-2.5 Watt (55-34dBm)
- Base station controller decides power control changes for both
  - Mobile measures signal strength, quality (BER) and reports to Base station
  - Goal: operate at lowest power level while maintaining acceptable signal quality

26

GPRS (General Packet Radio Service)

- The major GSM Phase 2+ enhancement and an important step to 3G
  - considered 2.5G
- Aims at providing data services to mobile users with high bandwidth efficiency and “always on” connectivity
- Address shortcomings of GSM
  - Low data rates (up to 9.6 kbps)
  - Long connection setup
  - Expensive
  - Circuit-switched

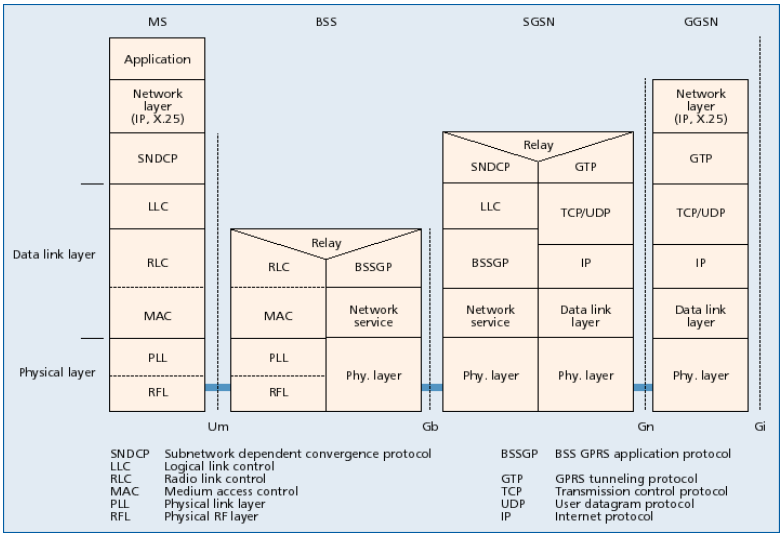
27

GPRS features

- Data rates up to 172 kbps
- Fast call setup times
- “Always on” connectivity
- Integrates IP infrastructure into the GSM network
- Uses packet-switched mechanisms
  - more efficient for bursty traffic
  - allow volume-based charging

28

Protocol architecture



29

Channel coding & transmission rate

- Coding used in every digital communication system to
  - increase channel capacity
  - protect against errors
- GPRS uses 4 different coding schemes, depending on channel conditions **physical layer**

Coding Scheme	Data Rate kbit/s	Channel Conditions
CS-1	9.05	Tough
CS-2	13.4	Tough to Moderate
CS-3	15.6	Moderate
CS-4	21.4	Good

- Up to 8 slots can be combined

Coding	Number of Timeslots			
	1	2	3	8
CS-1	9.05	18.1	27.15	72.4
CS-2	13.4	26.8	40.2	107.2
CS-3	15.6	31.2	46.8	124.8
CS-4	21.4	42.8	64.2	171.2

(Raw) Data Rate (Kb/s)

30

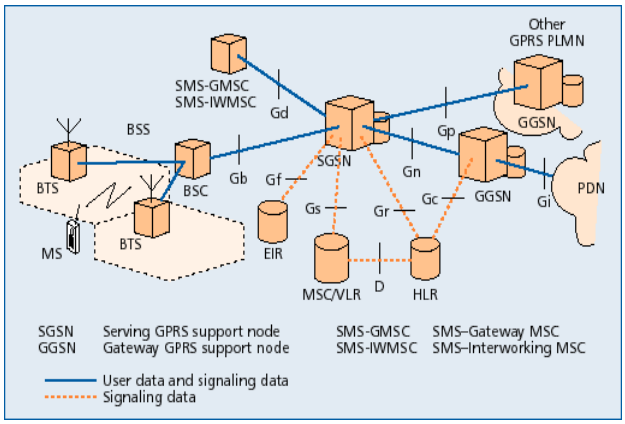
QoS

- GPRS Release 99 specified 4 traffic classes

Traffic Class	Medium	Application	Data Rate (kbps)	One-way Delay
Conversational	Audio Data	Telephony Telnet	4-25 <8	<150 ms <250 ms
Streaming	Audio Video Data	Streaming (HQ) One-way FTP	32-128 32-384 -	<10 s <10 s <10 s
Interactive	Audio Data	Voice Messaging Web-Browsing	4-25 <8	<1 s <4 s/page
Backround	Only Bit Integrity Is Required			

31

GPRS architecture



- 2 new nodes .
  - Serving GPRS Support Node (SGSN)
  - Gateway GPRS Support Node (GGSN)

32

Serving GPRS Support Node (SGSN)

- Serving GPRS Support Node (SGSN) is responsible for:
  - Admission control
  - Routing, mobility management, location management, authentication, charging
  - Receiving and delivering data packets
  - Address translation and mapping
  - Encapsulation

33

Gateway GPRS Support Node (GGSN)

- Gateway GPRS Support Node (GGSN)
  - acts as interface between GPRS backbone and external Packet Data Networks (PDN) or other Public Mobile Land Networks
  - converts GPRS packets coming from SGSN into the appropriate packet data protocol (PDP) format (e.g. IP)
  - converts the PDP addresses of incoming data packets to the GSM address of the destination user, and sends the readdressed packet sto the responsible SGSN

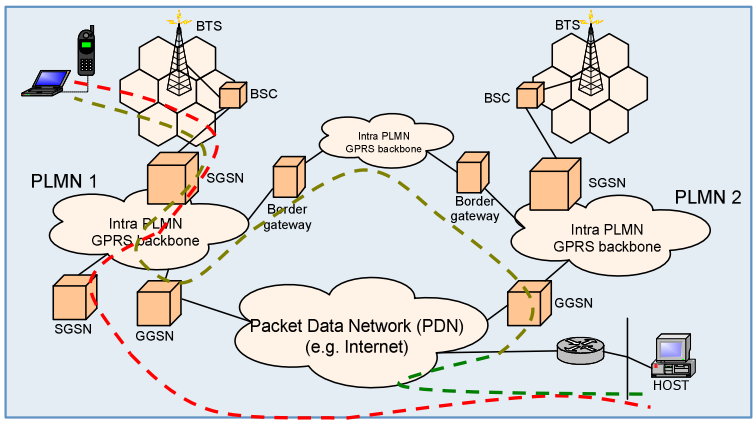
34

Additional enhancements

- Base Station System (BSS): enhanced to recognize and send user data to the SGSN that is serving the area
- Home Location Register (HLR): enhanced to register GPRS user profiles and respond to queries originating from SGSNs

35

Routing Scenarios



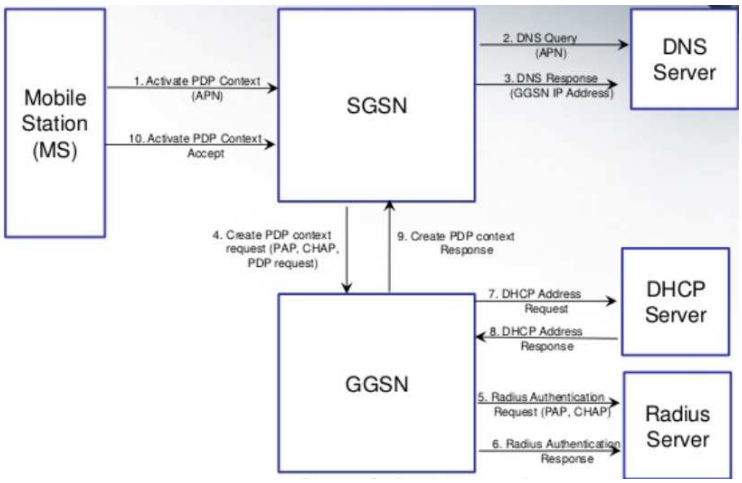
36

GPRS processes

- Attach process
- Authentication process
- PDP (Packet Data Protocol) activation process
- Detach process

37

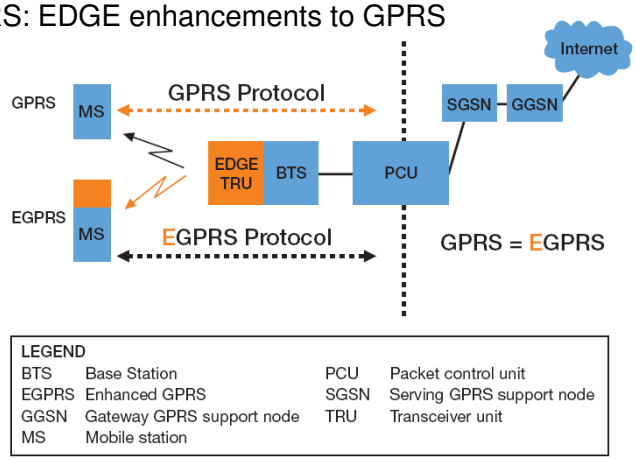
PDP context activation



38

Enhanced Data for GSM Evolution (EDGE)

- Higher data rates using 8PSK modulation
  - user rate 384 kbps (GPRS: 115 kbps)
- Software-only update (Release 99)
- EGPRS: EDGE enhancements to GPRS



LEGEND			
BTS	Base Station	PCU	Packet control unit
EGPRS	Enhanced GPRS	SGSN	Serving GPRS support node
GGSN	Gateway GPRS support node	TRU	Transceiver unit
